

ACG State Switcher – Key Components Overview

■ Badge

What it is: Small label overlay on the extension's toolbar icon.

How it works: Extension sets text (e.g., QA1, STG, PROD) and color (environment-specific). Can be per-tab or global. Reapplied when tabs reload or switch.

Where it lives: Toolbar icon only (ephemeral).

■ Light / Dark / System Mode

What it is: User-controlled theme for the popup UI.

How it works: Light/Dark: extension applies predefined CSS classes. System: follows OS/browser preference via prefers-color-scheme. Updates automatically if the OS theme changes.

Where it lives: Saved in extension storage, reapplied on popup load.

■ Cookies

What they are: Data that tells ACG/Meemic servers which state or environment to serve.

How it works: 1. Extension loads JSON with state cookies. 2. Injects them via browser cookies API. 3. Browser merges them into its cookie jar. 4. Server may overwrite them with Set-Cookie headers.

Where they live: In the browser's native cookie store, scoped by domain/path/flags.

■ Visual Snapshot

Component	Controlled By	Stored In	Visible In
Badge	Extension (API)	Ephemeral (no storage)	Toolbar icon
Theme	Extension + System	Extension storage	Popup window
Cookies	Extension + Browser	Browser cookie DB	DevTools → Application → Cookies
